## JPMorgan Chase & Co

*23 March, 2023*

I am excited to apply for the software developer intern position at JP Morgan.I am pursuing B Tech in Computer Engineering at DJ Shanghvi College, Mumbai, and looking to gain hands-on experience in software development, and adding significant value in whatever ways I can.

Throughout the past year, I have worked on various college projects, which have given me a strong foundation in programming, and familiarised me with frameworks and libraries that can be used in real life. As a complete team player, I have worked with backend and front-end developers, both web and app ones, and UI/UX designers – for projects simulated in a corporate environment. This has helped me acquaint myself with infrastructure, architecture and design across multiple systems.I am proficient in C and Java, which I frequently use to solve data structure and algorithmic issues, and improve my problem-solving skills.

In addition to my technical skills, I have developed an understanding of business processes, think laterally and keep an eye on areas where technology can drive growth and efficiency.Working at JP Morgan is a dream because it will enable me to interact in the financial sector mavens in challenging projects at the very cutting edge.

Your culture of excellence in client service, operations, sense of responsibility and the determination to win personify my ideal working environment, and encourages me to apply for internship.JP Morgan's presence on my campus to seek young talent underscores its proactive approach, which is extremely impressive. To sum up, this is a dream internship for me, and if selected, I will do everything required of me – and then some – to justify the faith reposed.

Sincerely,
Aman Nambisan
